

The Evolution of Optical Sectioning Microscopy

Choosing the correct method for your application

Since the initial commercialisation of laser scanning microscopes in the mid 1980's, optical sectioning has become a major application for light microscopy. Optical sectioning techniques are no longer limited to laser scanning microscopy but have branched into many differing designs and architectures. This talk will discuss the Carl Zeiss perspective on the ever changing and diversifying technologies as well as presenting recent changes to our portfolio.
